

1 Abstract of the Disclosure

2 A system and method for establishing and retrieving data based upon global indices
3 established on the date of first use by a user. The system uses a distributed data name service
4 (DDNS) which uniquely identifies users of the system based upon the unique ID of devices on
5 the system combined with the date and time of first use by the user. Both the unique device ID
6 and the unique user ID's are stored on servers of the system. This unique user ID generated is
7 used for all subsequent uses of the system by the user. Searching for data generated by devices of
8 the system relating to a particular user is accomplished by searching for instances of the user ID
9 on servers of the system rather than by searching for the data itself. A simplified data transport
10 protocol allows for the transfer of data from one location to another after the data is located.
